

Project proposal October 2015:

Company: VoerEir, Stockholm

The most dramatic technology transformation in 130 years is starting in Telecom called Network Function Virtualization (NFV). This change is coinciding with Opensource becoming the new way of implementing cloud infrastructures with technologies such as Openstack, KVM, CEPH Opendaylight becoming the new standard. The telecom operators and suppliers are therefore facing a transforming Telecom Industry where new players and way of thinking is required. This change is not only happening in the Telecom industry but also in several adjacent verticals. VoerEir is a newly started company with the mission to establish a unique market position and technology leadership in this transforming industry. The work that VoerEir is planning for this thesis will require technology studies in the forefront of this transforming industry and give good opportunities to continue with the area after the thesis. This transformation journey will be a key priority for all stakeholders involved for many years to come.
