IEEE WCNC  
Marrakech, April 2019

# Outline

- Background
- PoliFi design
- Evaluation
- Future work

# Main Contributions

PoliFi is an **airtime policy** enforcement system that:

- Supports individual **station** and **group** policies
- Runs entirely on the access point
- Is included in the **mainline Linux** kernel from v5.1

# Background

- 802.11 Performance Anomaly
- Previous Work: Airtime Fairness Scheduler

# 802.11 Performance Anomaly

Effective transmission time  $T(i)$  and rate  $R(i)$  (for station  $i \in I$ ):

$$T(i) = \begin{cases} \frac{1}{|I|} & \text{with fairness} \\ \frac{T_{data}(i)}{\sum_{j \in I} T_{data}(j)} & \text{otherwise} \end{cases}$$
$$R(i) = T(i)R_0(i)$$

Where  $R_0(i) = \frac{L_i}{T_{data}(i) + T_{oh}}$  is the effective rate of a station transmitting without collisions.

# Previous Work: Airtime Fairness Scheduler

# PoliFi Design

What if we don't want straight fairness?

# Design Goals

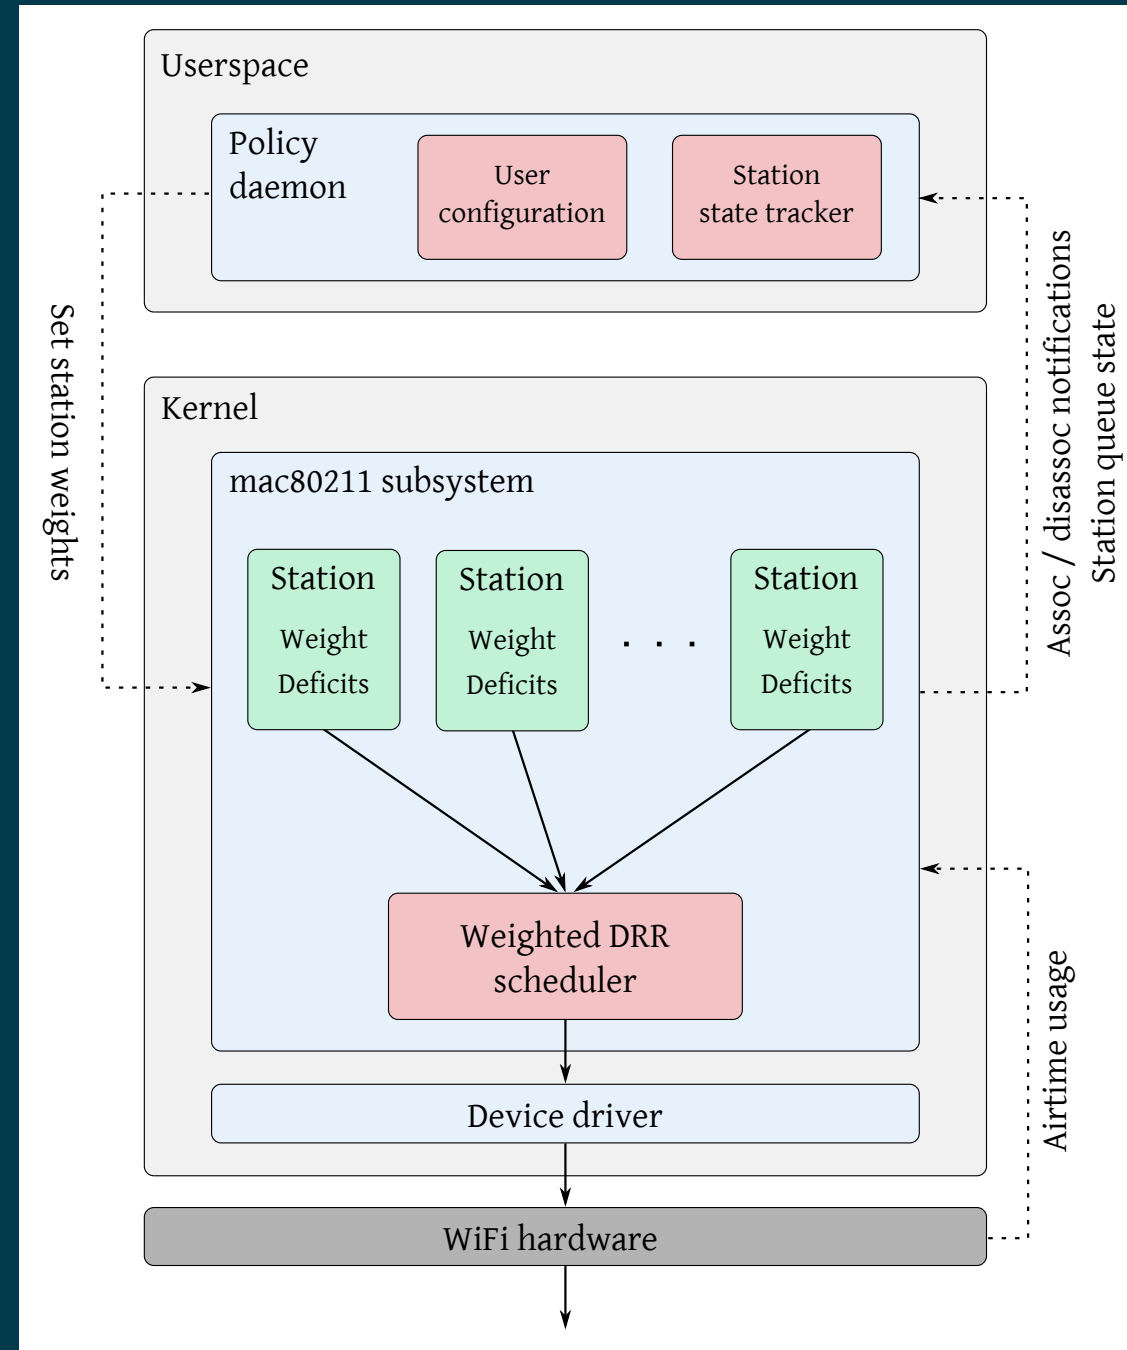

Enable airtime policy enforcement, supporting:

- Prioritising **single** devices
  - Use case, e.g.: “My TV needs more airtime”
- Balancing device **groups**
  - Use case, e.g.: 5G network slicing
- Limiting groups of devices to a **maximum** capacity share
  - Use case, e.g.: Guest network

# PoliFi Design

# Operating Modes

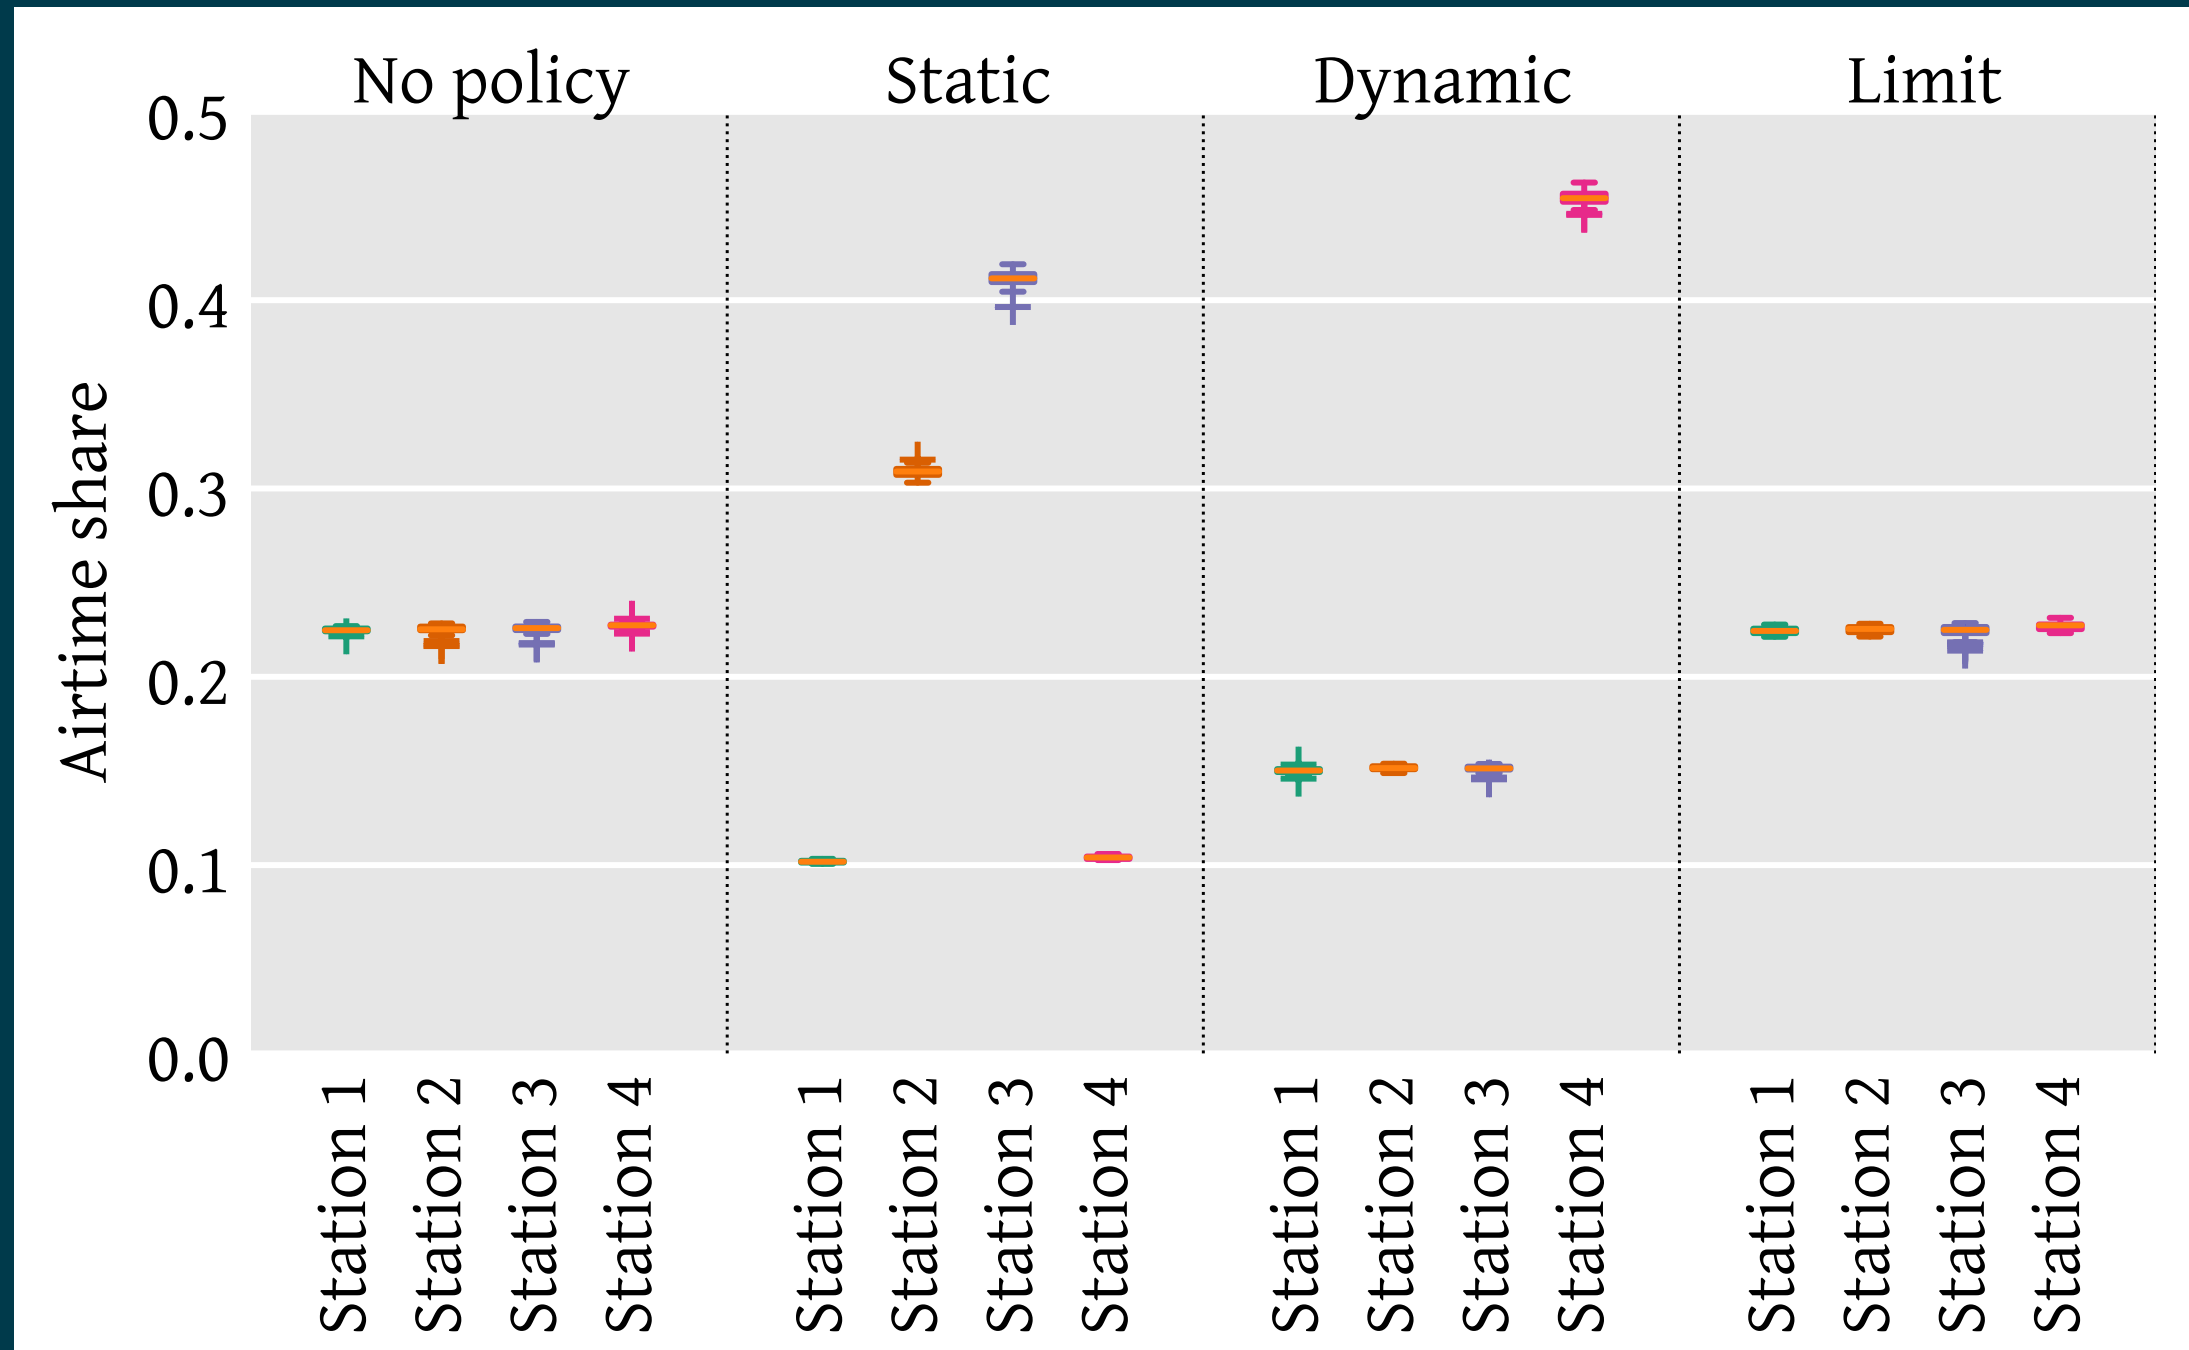

Weights set by userspace daemon (hostapd), supporting three modes:

- **Static** mode: Specify MAC priority in config
- **Dynamic** mode: Specify weight per group (BSS)
- **Limit** mode: Like dynamic, but only limit some groups

# Evaluation results

- 4 station test, 2 groups (BSSes)
- BSS 1: Stations 1, 2 and 3
- BSS 2: Station 4

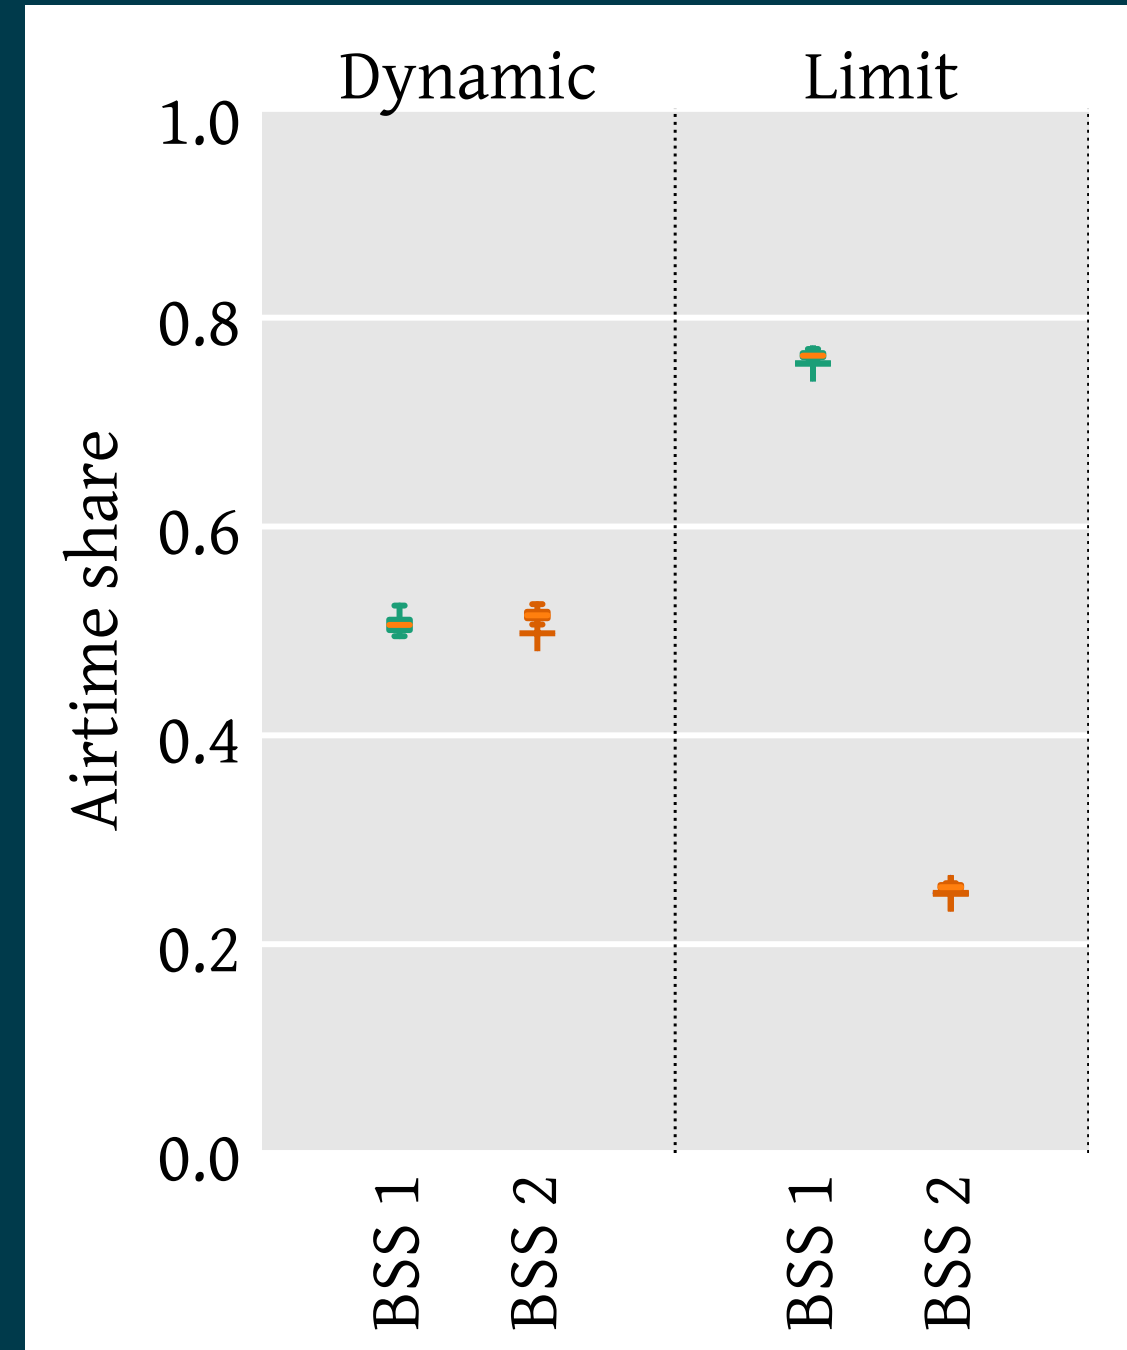

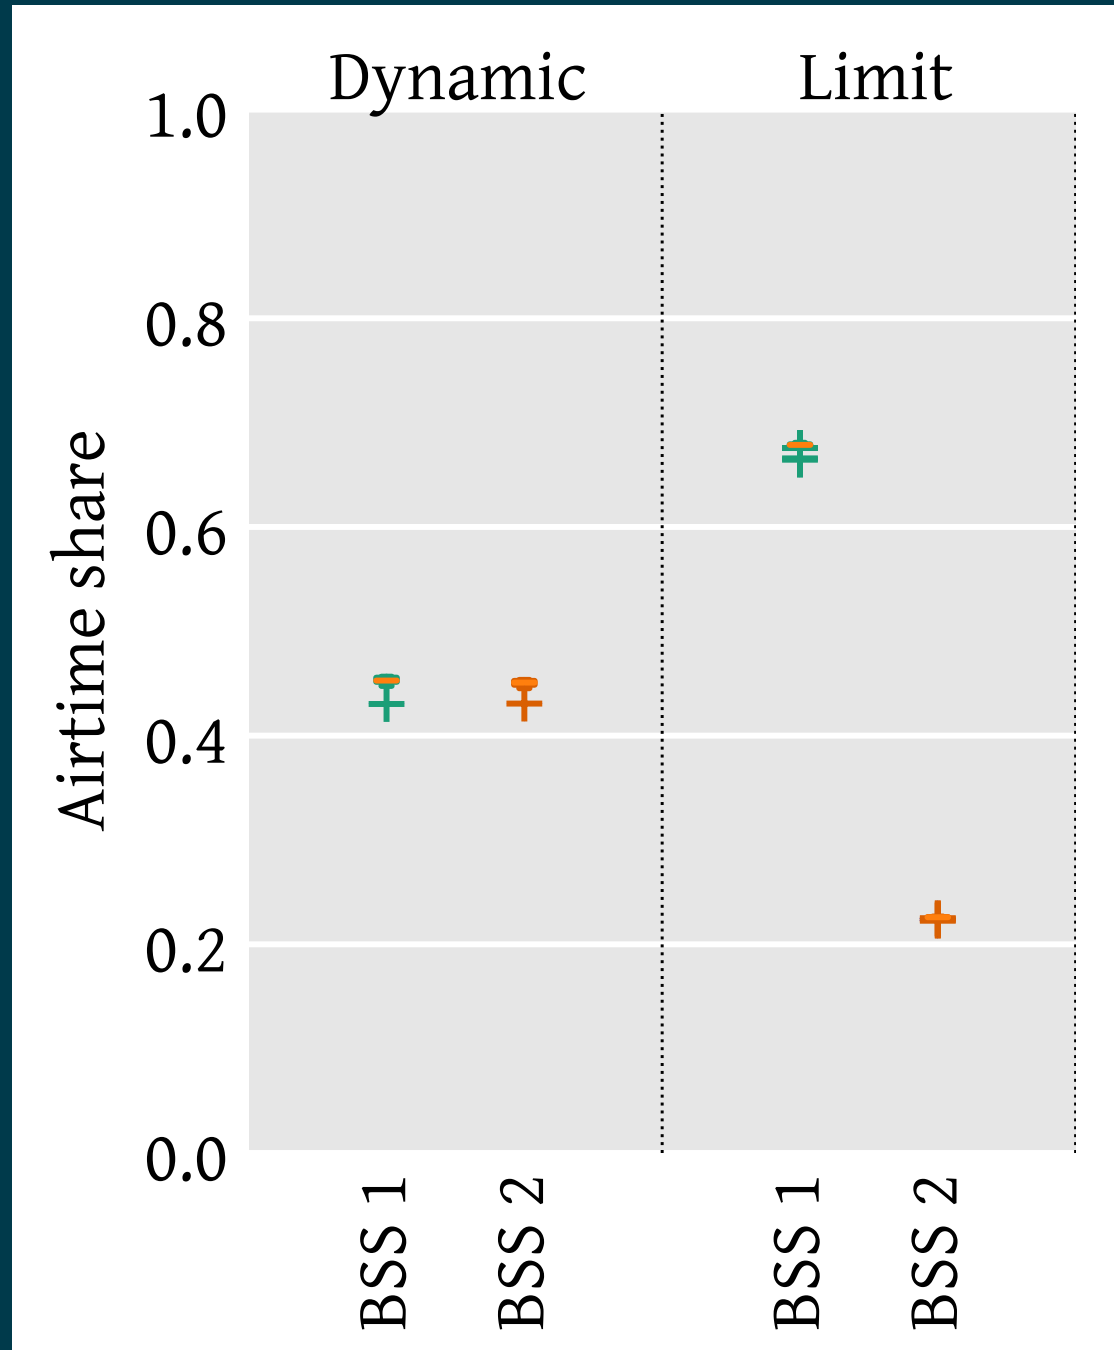

# Airtime usage - UDP

# Airtime usage - TCP

# BSS airtime usage - UDP and TCP

# Reaction time - dynamic mode

# Reaction time - limit mode

# DASH video throughput

# Future work

# Planned future work

Future work being discussed in upstream Linux:

- Switching to a virtual time-based scheduler
- Airtime estimation for devices that don't provide it
- Airtime-based queue limits

# Summary

PoliFi is an **airtime policy** enforcement system that:

- Supports individual **station** and **group** policies
- Runs entirely on the access point
- Is included in the **mainline Linux** kernel from v5.1
